

VIJAY P

DevOps Engineer | CI/CD, Kubernetes & Cloud Automation

Manamadurai, Tamil Nadu, India | vijaynisha343@gmail.com | +91-9342641524

github.com/vijaypandiselvam | linkedin.com/in/vijay-p

PROFESSIONAL SUMMARY

DevOps Engineer with hands-on experience building and managing end-to-end CI/CD pipelines using Jenkins, Docker, and Kubernetes, with practical exposure to Microsoft Azure and Infrastructure as Code. Skilled in Linux administration, Git-based version control and release workflows, deployment automation, and continuous monitoring using Grafana and Prometheus. Experienced in root-cause analysis and troubleshooting across the delivery pipeline (Docker daemon, cluster connectivity, TLS, manifest errors) and in producing clear technical documentation for automation and support teams. Comfortable in fast-paced, agile team environments and eager to apply and extend this foundation toward AWS and GoCD-based deployment pipelines in a banking/financial services setting.

CORE TECHNICAL SKILLS

CI/CD & Release Engineering: Jenkins Pipelines, CI/CD Pipeline Design, Deployment Automation, Release Management, Version Control Workflows, Code Versioning

Containers & Orchestration: Kubernetes (Deployments, Services, Namespaces, kubectl), Docker, Docker Compose, Docker Hub

Cloud & Infrastructure: Microsoft Azure (VMs, Blob Storage, Azure AD Fundamentals), Infrastructure as Code (IaC), Cloud Deployment & Automation

Monitoring & Reliability: Grafana, Prometheus (familiar), Continuous Monitoring, Root Cause Analysis (RCA), Production Troubleshooting

Version Control & Docs: Git, GitHub, Branching/Merging/PR Workflows, Technical Documentation for Automation & Support Teams

Scripting & Automation: Python, Shell/Bash Scripting, YAML, Automation Scripting

Backend, APIs & Databases: Django, FastAPI, REST APIs, Swagger, Postman, MySQL, PostgreSQL

TECHNICAL EXPERIENCE

Django Web Development Intern — Phenoix Softech | Madurai, India

- Built and tested backend modules using Django and Python, implementing models, views, and REST API endpoints to support production-style web applications.
- Integrated MySQL databases with Django ORM and validated API responses using Swagger and Postman, improving reliability of service documentation and testing.
- Followed Git-based version control workflows (branching, merging, pull requests) with the development team to manage code changes and streamline release cycles.
- Debugged application issues across the stack through root-cause analysis, contributing to smoother releases and reduced defect turnaround time.

PROJECTS

End-to-End CI/CD Pipeline for an E-Commerce Platform (React, FastAPI, PostgreSQL)

Docker, Jenkins, Kubernetes, Docker Hub, GitHub, CI/CD, kubectl | [GitHub Repo](#)

- Designed and built a complete end-to-end DevOps deployment pipeline automating the path from source code to containers to registry to Kubernetes for a full-stack e-commerce application — directly analogous to production CI/CD pipeline ownership for in-house applications.
- Containerized the React frontend, FastAPI backend, and PostgreSQL database with Docker, and built a Docker Compose environment for local multi-container development.
- Built a Jenkins CI/CD pipeline integrated with GitHub to automate image builds, versioning, and publishing to Docker Hub, mirroring enterprise release engineering practices.

- Authored Kubernetes manifests for Namespaces, Deployments, and Services; automated deployment to a Kubernetes cluster and configured Jenkins with kubectl for cluster communication and post-deployment health checks — a pattern directly transferable to Kubernetes-based deployment automation.
- Performed root-cause analysis on real-world CI/CD failures (Docker daemon permissions, Kubernetes connectivity from Jenkins, TLS certificate errors, missing manifests), closing gaps in the delivery pipeline and strengthening troubleshooting skills across the DevOps toolchain.

CRONOS — Privacy-First Python Contract Validator

Python, Static Analysis, AST Parsing, CI Gating

- Engineered a static analysis automation tool that validates proposed code changes against client-defined rules locally, without executing or transmitting source code — a pattern applicable to secure CI/CD pipeline gating for regulated environments such as banking.
- Designed rule-checking logic to parse code structure and flag violations automatically, improving security posture and supporting standardized documentation for teams handling proprietary codebases.

EDUCATION

Bachelor of Engineering, Computer Science and Engineering

Sep 2022 – May 2026

St. Michael College of Engineering and Technology | CGPA: 8.0

CERTIFICATIONS

DevOps and Kubernetes — Udemy | JavaScript — Great Learning
